## I. In the claims:

- 1. (Previously Amended) A robotic apparatus comprising:
  - (a) a controller adapted to process a signal to an actuator;
  - (b) a dynamic feedback control system between a sensor and said actuator, said control system having said sensor to sense input and to communicate a wireless signal of said sensor with said actuator;
  - (c) said actuator adapted to receive said signal and to actuate a robotic part in response to said input exceeding a defined threshold;
  - (d) wherein said sensor is a biometric sensor with input selected from the group consisting of: position, velocity, acceleration, force, and auditory.
- 2. (Original) The apparatus of claim 1, further comprising said robot having a sensor.
- 3. (Original) The apparatus of claim 1, wherein said input of said user is physical.
- 4. (Original) The apparatus of claim 1, wherein said sensor is secured to said user.
- 5. (Original) The apparatus of claim 1, wherein said sensor is secured to a console.
- 6. (Previously Amended) The apparatus of claim 1, wherein said biometric sensor input is selected from the group consisting of: thermal, electrical, optical, scent, video, ultrasound, infra red, pressure, and electromagnetic radiation.
- 7. (Original) The apparatus of claim 1, wherein said robotic part is selected from the group consisting of: an arm assembly, a leg assembly, a head assembly, facial components, any actuator in communication with the controller, and combinations thereof.

- 8. (Original) The apparatus of claim 1, further comprising a computer to store data received from said sensor.
- 9. (Previously Amended) The apparatus of claim 8, wherein said computer is mounted in a location selected from the group consisting of: internal to said robotic part, internal to said sensor, external to said robotic part, and combinations thereof.
- 10. (Previously Amended) The apparatus of claim 1, further comprising an operator interface to modify configuration of said robotic part.
- 11. (Previously Amended) The apparatus of claim 10, wherein said operator interface includes a menu to select an interactive mode of operation between said robotic part and said user.
- 12. (Original) The apparatus of claim 10, wherein said operator interface allows an operator to evaluate said user input.
- 13. (Previously Amended) The apparatus of claim 10, wherein said operator interface is accessible from a location remote from said robotic part and said user.
- 14. (Original) The apparatus of claim 10, wherein said operator interface allows an operator to program an unique interactive mode of operation.
- 15. (Previously Amended) The apparatus of claim 1, wherein said robotic part is selected from the group consisting of: a physical apparatus, a virtual apparatus, and combinations thereof.
- 16. (Previously Amended) A method for controlling a robotic apparatus comprising:

- (a) reading sensor data in communication with said apparatus;
- (b) processing sensor data;
- (c) transmitting said sensor data over a wireless connection from said sensor to a receiver in communication with said apparatus;
- (d) parsing said sensor data;
- (e) activating an actuator of said robot in response to said parsed data;
- (f) interacting with said apparatus in a dynamic feedback control system,
- (g) wherein the step of processing said sensor data includes functions selected from the group consisting of: analog to digital converting, compressing said data, mapping said data, thresholding said data, and pattern recognition.
- 17. (Original) The method of claim 16, further comprising the step of providing feedback from said apparatus to a user.
- 18. (Original) The method of claim 17, wherein said feedback is biometric feedback selected from the group consisting of: visual, tactile, auditory, and combinations thereof.
- 19. (Original) The method of claim 16, wherein the step of processing said sensor data includes processing physical input signals.
- 20. (Original) The method of claim 16, further comprising the step of directly transmitting said sensor data to said apparatus for controlling said actuator of said apparatus in real-time.
- 21. (Previously Amended) The method of claim 16, wherein the step of processing said sensor data includes functions selected from the group consisting of: filtering said data, and encrypting said data.
- 22. (Original) The method of claim 16, wherein the step of parsing said sensor data includes

functions selected from the group consisting of: analog to digital converting, de-encrypting said data, de-compressing said data, pattern recognition, mapping said data, filtering said data, thresholding said data, and combinations thereof.

- 23. (Original) The method of claim 16, further comprising the step of recording said sensor data.
- 24. (Original) The method of claim 23, further comprising the step of retrieving said recorded sensor data and playing said data for activating select parts of said apparatus associated with said data.
- 25. (Original) The method of claim 23, wherein the step of recording said sensor data includes saving said data in a medium in communication with an apparatus selected from the group consisting of: said sensor, said apparatus, a remote console, and combinations thereof.
- 26. (Original) The method of claim 23, further comprising the step of accessing said sensor data from a remote location for evaluation of said data.
- 27. (Original) The method of claim 16, wherein the step of interacting with said apparatus in a dynamic feedback control system includes the step of providing interactive communication between said sensor and said apparatus.
- 28. (Original) The method of claim 16, further comprising the step of modifying configuration of said apparatus through an operator interface in wireless communication with said apparatus.
- 29. (Original) The method of claim 28, wherein the step of modifying configuration of said apparatus includes modifications selected from the group consisting of:

mapping of said sensor data from said operator interface to said apparatus, modifying thresholds and gains, selecting a platform for interactive communication attributes of said apparatus, and combinations thereof.

- 30. (Original) The method of claim 16, further comprising the step of connecting said apparatus to a communication network.
- The method of claim 16, further comprising the step of connecting a remote console to a communication network.
- 32. (Previously Amended) An article comprising:
  a computer-readable signal-bearing medium;
  means in the medium for sending data over a wireless connection;
  means in the medium for communicating activation of a signal in a remote robotic

means in the medium for remotely setting configuration parameters of a sensor and an actuator of said robotic apparatus;

apparatus;

means in the medium for providing dynamic interaction between said robotic apparatus and a user in communication with said robotic apparatus,

wherein said configuration parameters are selected from the group consisting of mapping, calibration, thresholding and gains.

- The article of claim 32, wherein the medium is selected from the group consisting of: a recordable data storage medium, a modulated carrier signal, and combinations thereof.
- 34. (Original) The article of claim 32, wherein said means for communicating activation of a signal is a communication protocol.
- 35. (Original) The article of claim 32, wherein said means for remotely setting configuration

## parameters is a graphical user interface.

- 36. (Previously Canceled) The article of claim 32, wherein said configuration parameters are selected from the group consisting of: mapping, calibration, thresholding and gains, and combinations thereof.
- 37. (Previously Amended) The article of claim 32, further comprising conducting assessment of signal data in said medium.
- 38. (Original) The article of claim 32, further comprising providing remote interaction between an operator to said robotic apparatus in real-time in said medium.
- 39. (Original) The article of claim 38, wherein said remote interaction includes retrieving a set of instructions to provide interactive communication between said robotic apparatus and said user.
- 40. (Original) The article of claim 32, further comprising saving said data in said medium.
- 41. (Original) The article of claim 32, further comprising transmitting said data to a computer remote from said robotic apparatus.
- 42. (Previously Amended) The article of claim 41, further comprising conducting assessment of said data in said medium.
- 43. (Previously Amended) A wireless signal communication system comprising:
  - (a) a sensor in remote communication with an actuator;
  - (b) a power control module;
  - (c) a transceiver;
  - (d) a central processing unit; and
  - (e) a dynamic control system between said sensor and said actuator adapted to enable

- control of said actuator in response to feedback communicated to said sensor,
- (f) wherein said sensor is a biometric sensor whose input is selected from a group consisting of: position, velocity, acceleration, force, and auditory.
- 44. (Original) The system of claim 43, wherein said transceiver and said central processing unit are adapted to receive and process sensor data and to transmit said data to said actuator.
- 45. (Original) The system of claim 43, further comprising a plurality of wireless sensors in communication with a single central processing unit.
- 46. (Original) The system of claim 45, wherein said plurality of sensors are physically connected.
- 47. (Original) The system of claim 43, further comprising a plurality of central processing units with each unit comprising a plurality of connected sensors.
- 48. (Original) The system of claim 43, wherein said actuator is selected from the group consisting of: virtual and physical, and combinations thereof.
- 49. (Original) The system of claim 43, wherein said transceiver and said central processing unit are connected to a communication network.
- The system of claim 43, wherein said biometric sensor input is selected from a group consisting of: thermal, electrical, optical, scent, infra red, ultrasound, video, pressure, and electromagnetic radiation.
- The apparatus of claim 2, wherein said robot sensor is a biometric sensor whose input is selected from the group consisting of: thermal, electrical, and optical.
